

1. Shared Folders Overview

Screenshot: Overlay of folders to be shared: IT-Docs, HR-Docs, Accounting-Docs, Public.

Description:

- Created departmental shared folders on the file server VM to simulate real-world corporate storage.
- Each folder represents an OU: IT, HR, Accounting, plus a Public share for all users.
- Purpose: organize files per department and demonstrate access control, quotas, and file screening.

2. Shared Permissions

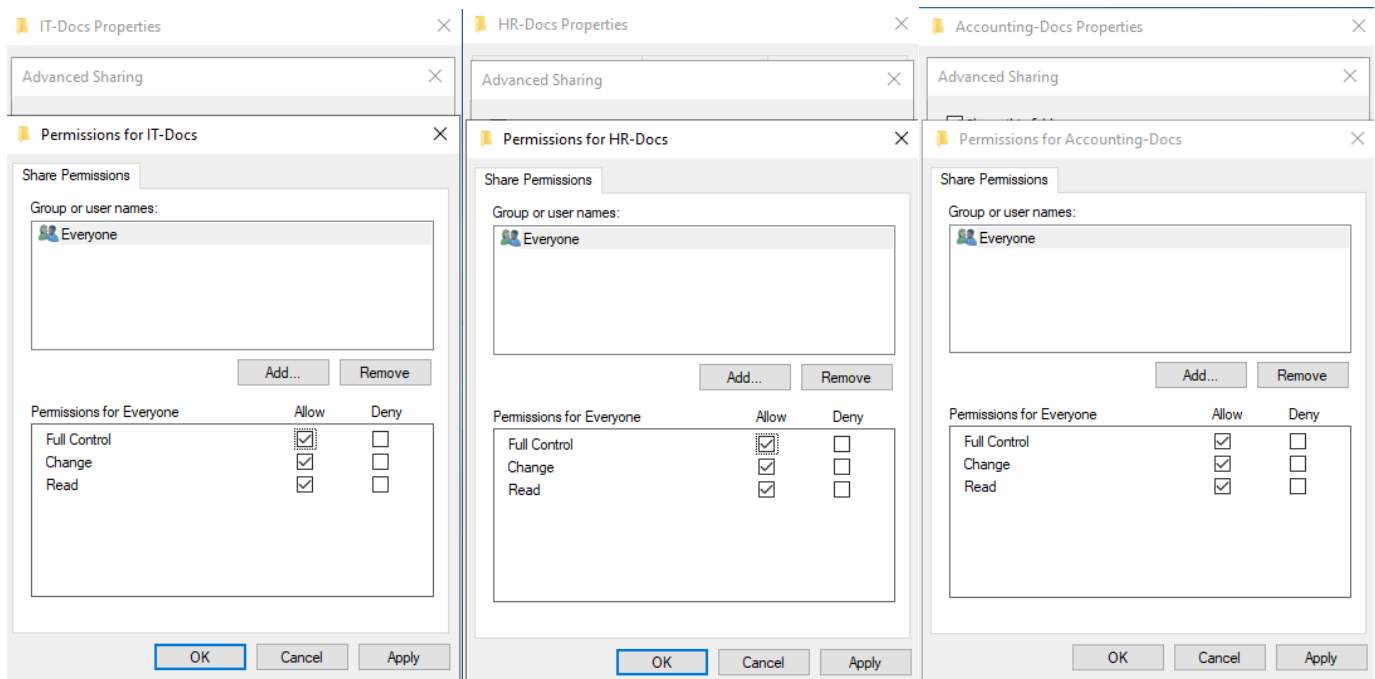

Screenshot: Three-set screenshot of folder **Sharing** → **Advanced Sharing** → **Permissions**, showing “Everyone = Full Control” for each folder.

Step-by-Step:

1. Right-click folder → Properties → Sharing tab → Advanced Sharing.
2. Checked “Share this folder.”
3. Assigned Everyone = Full Control for simplicity; NTFS will enforce actual access.

Rationale:

- Share permissions are coarse; giving Everyone Full Control allows the **NTFS permissions to fully manage actual access** while still sharing the folder on the network.

3. NTFS Permissions

Screenshot: Three-set screenshot of **Security tab**, showing:

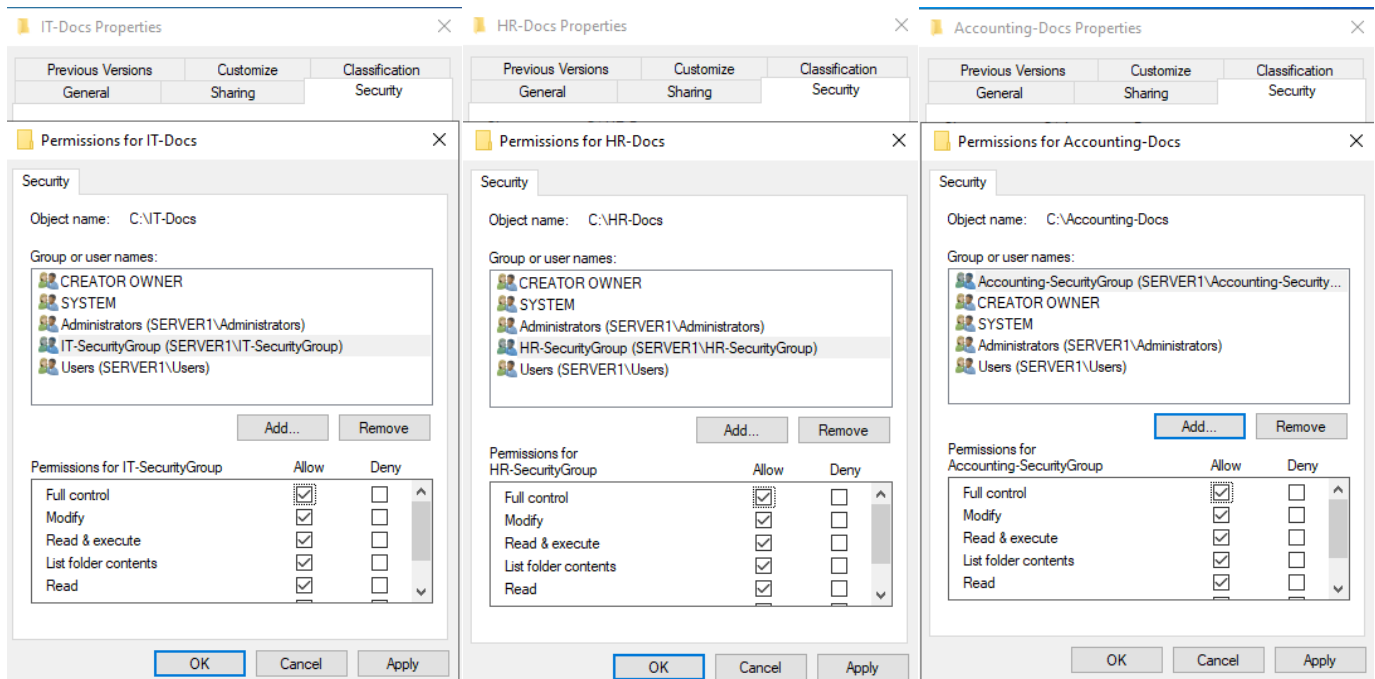

- IT Security group has Full Control for IT-Docs
- HR Security group has Full Control for HR-Docs
- Accounting Security group has Full Control for Accounting-Docs

Step-by-Step:

1. Right-click folder → Properties → Security tab → Edit → Add → select respective security group.
2. Assigned **Full Control** for that group only.
3. Removed unnecessary groups to restrict access.

Rationale:

- NTFS permissions provide **fine-grained access control**, ensuring only the appropriate departmental users can access their respective folders.

4. Network Drive Mapping via GPO

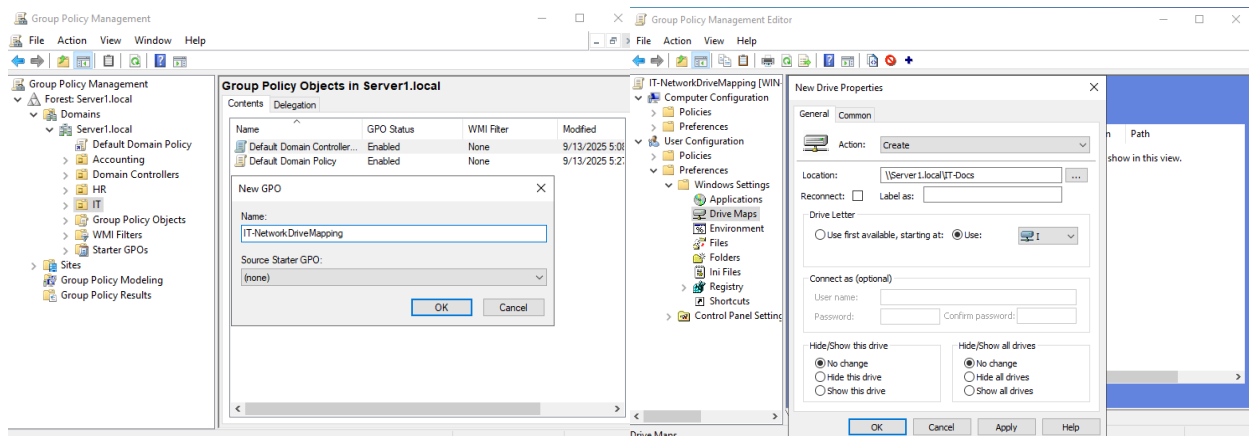

Screenshot: Two-set screenshot showing creation of IT/HR/Accounting-NetworkDriveMapping GPOs, then **Drive Maps** settings.

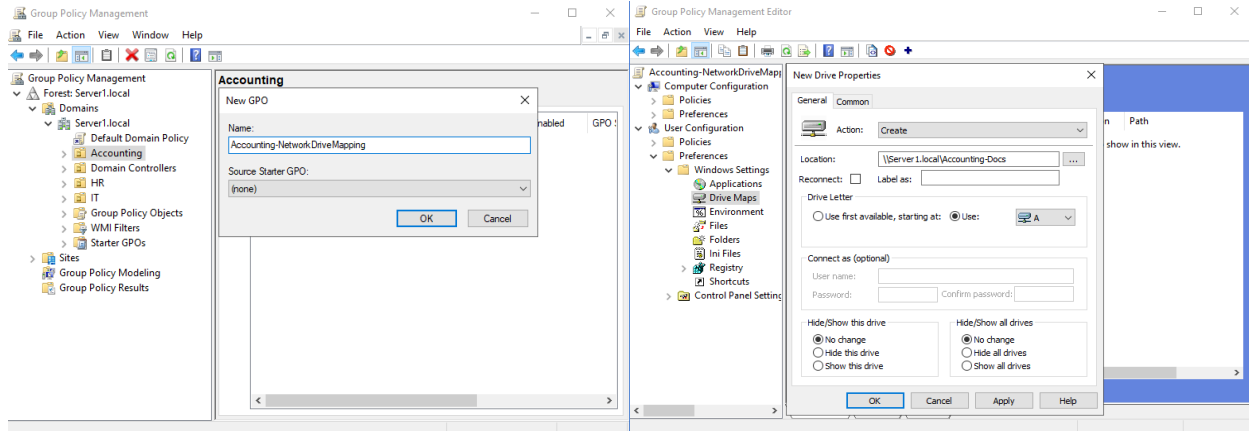

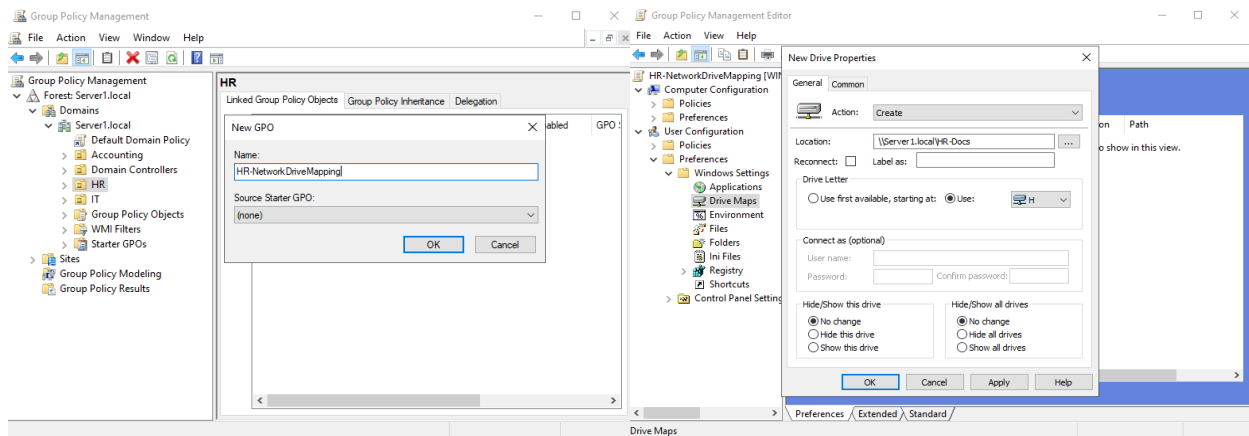

Step-by-Step:

1. Open Group Policy Management → right-click OU → Create GPO → Name it Department-NetworkDriveMapping.
2. Edit GPO → User Configuration → Preferences → Windows Settings → Drive Maps → New → Mapped Drive.
3. Set **Location** to \\Server\FolderName and assign a **drive letter** (e.g., Z:).

Rationale:

- Automatically maps departmental shared folders to users' computers via GPO.
- Ensures **consistent access** to required resources without manual mapping.

5. Quotas with FSRM

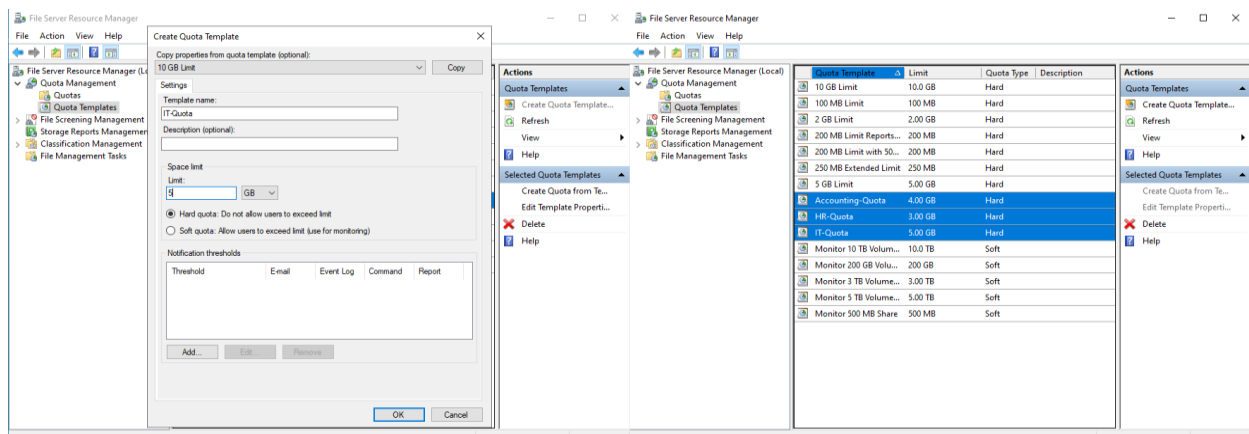

Screenshot: Four-set screenshot: creating three **Quota Templates** (Accounting/HR/IT-Quota) and assigning them to respective folders; Public folder has a custom max total quota.

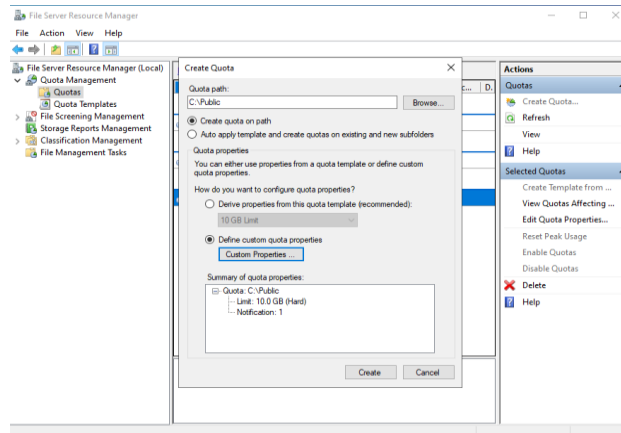

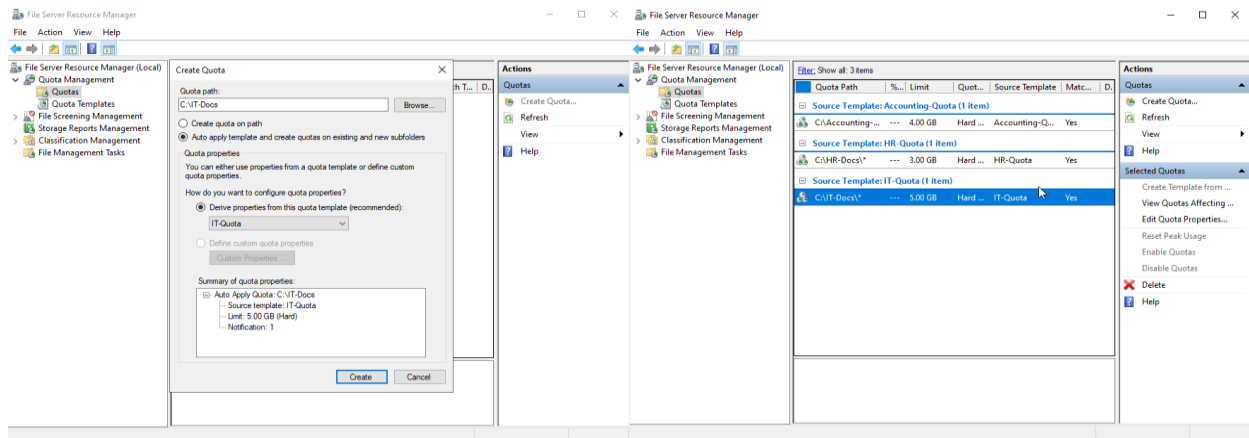

Step-by-Step:

1. Open FSRM → Quota Management → Create Quota Template.
2. Templates created for IT (5GB/user), HR (3GB/user), Accounting (4GB/user).
3. Assigned **Auto Apply Template** to departmental folders to enforce **per-user limits** automatically.
4. Public folder received a **max total quota of 10GB**, applied manually (not auto-applied).

Rationale:

- **Per-user quotas** ensure departmental users don't exceed storage allocation.
- **Max total quota** on Public folder prevents overall folder from exceeding capacity.

6. File Screening

Screenshot: File groups creation and mapping to file screens:

Department	Blocked File Types
Accounting	7z, avi, bat, cmd, exe, mp3, mp4, ps1, rar, vbs, zip
HR	7z, avi, bat, cmd, exe, mov, mp3, mp4, ps1, rar, zip
IT	7z, bat, cmd, exe, rar, zip

Step-by-Step:

1. Open FSRM → File Screening Management → File Groups → Create New File Group.
2. Added listed extensions per department.
3. Applied the file group to the respective **File Screen** for each departmental folder → Action: **Active (Block)**.

Rationale:

- **IT:** block unnecessary archives and executables while allowing essential scripts; balances flexibility with security.
- **HR & Accounting:** block executables, scripts, media, and archivess to prevent malware and unapproved personal files in sensitive folders.
- Provides **realistic corporate file control policies** that demonstrate AD-adjacent security skills.
